1 Description

This device is an implementation of a general load controller LCBF1. This device is implemented as described in [1]. Implementation details can be viewed by inspecting the subcircuit of this device.

1.1 Pins

This device has 4 pins:

Pin name	Type	Description	Units
Pe_set	Input	Electrical power set point	pu
w	Input	Mechanical speed	pu
Pe	Output	Electrical power	pu
Pref	Output	Reference to be connected to the turbine	pu

1.2 Parameters

The default set of parameters are obtained from [1].

1.2.1 Data tab

The parameters on the Data tab are:

1. **Time constant T_{Pelec} :** power transducer time constant
2. **Deadband db :** controller deadband
3. **Gain fb :** frequency bias gain
4. **Gain K_p :** proportional gain
5. **Gain K_i :** integral gain
6. **Maximum output I_{rmax} :** maximum output

2 Initial conditions

The initial set point must be equal to the generator electrical power (base for power) at $t = 0$ s.
